Change and Exception handling

- Changes to initial plans can occur during development phase
    - How to handle:
        - Identify the cause of change
        - Identify the changes to be made
        - Check the schedule if there is enough time to execute the change
        - Analyze if the change would cause a problem to the scheduled completion of the project
        - Perform the necessary actions to adapt to changes
- Exception Handling
    - The development team would be implementing Agile Methodologies such as "sprints" to easily adapt to sudden changes.
    - Exception Handlings will be done under the Application layer of our system
    - The Application must be consistent into what information is stored
    - The Application must check for Important Text fields that can't be left empty
    - It must be able to check the user authority to use the application

Version Control

Why use version control? What are the Benefits of version control?

- The Developers will use Git as the version control
- Github is used to store the repository for the application
